

National indicator - Coal prices

Unit €/kWh
Source BSO
Last update 2015

The “*coal prices*” indicator represents average household prices per kWh generated from coal used at the household level in boilers, stoves, etc.

DEFINITION

The indicator is linked to one of the three major causes of energy poverty, the cost of energy, as higher prices are connected with increase in energy poverty. However, it contains **limits**:

LIMITS

- For comparison between countries, it should be analysed in Purchasing Power Standard currency unit
- It should be cross analysed with data on fuel/ technology mixes in the country
- It should be supplemented with other indicators portraying the social, infrastructural, and behavioral dimensions

More details and additional insights on the indicator are available in the EPAH report “[Energy Poverty National Indicators: Insights for a more effective measuring](#)”.
